Preventive Vaccines Schedule

Purpose
<p>To define the conditions for coverage of preventive immunizations for adult and pediatric members, in accordance with:</p> <ul style="list-style-type: none"> • American Academy of Pediatrics (AAP) for pediatric members, and • American Academy of Family Physicians (AAFP) for adult members.

Definition
<p>Immunization is a technique used to induce immune resistance to a specific disease in humans by exposing the individual to an antigen to raise antibodies against it. This process increases an individual's reaction to an antigen and therefore improves the ability to resist or overcome infection.</p> <p>Immunization is among the safest and most effective medicines. The overwhelming majority of medical experts in the United States and abroad believe that the benefits of complete immunization far outweigh the risks. Global health experts are in full agreement that everyone who is healthy should be immunized as recommended.</p> <p>Immunization is the process of artificially inducing immunity by administering an immunobiologic. Immunization can be active or passive. Active immunization is the induction of antibodies or other immune responses by administering a vaccine or toxoid. Passive immunization is the provision of temporary immunity by administering preformed antibodies. Recommendations for vaccinating infants, children, and adults are based on the characteristics of immunobiologics, scientific knowledge of the principles of active and passive immunization, disease epidemiology, and judgments by public health officials and specialists in clinical and preventive medicine. Immunization programs help build defenses against disease and should be initiated early and administered regularly.</p> <p>Childhood immunizations consist of a series of intramuscular injections, subcutaneous injections, or oral dosing of inactivated bacteria, toxoids, live attenuated viruses, or inactive viral antigens against several diseases: diphtheria, tetanus, pertussis, measles, mumps, rubella, polio, Haemophilus</p>

influenzae type b, human papilloma virus (HPV), hepatitis A, hepatitis B, influenza, varicella, pneumococcus and rotavirus. Many immunizations are administered in combination during routine well-child visits in the first 2 years of life. Immunizations against diseases for which risk factors are related to adolescent issues are recommended at ages before exposure most frequently occurs. These include meningitis, hepatitis B, and HPV.

Most adult immunizations are administered as part of the primary series (to previously unimmunized individuals), as booster doses, and periodically. Agents include toxoids (diphtheria and tetanus), live virus vaccines (measles, mumps, and rubella), influenza (including trivalent formulations), inactive viral particles (hepatitis B), highly purified virus-like particles (HPV), inactivated bacterial polysaccharide and conjugate vaccines (pneumococcal, including higher-valent options like PCV21), inactivated vaccines (polio for incomplete vaccination), and mRNA or protein-based vaccines (for example for respiratory syncytial virus [RSV] and mpox).

Vaccines that use a non-viral vector or messenger RNA (mRNA) delivered via a nucleic acid-based agent are the most recent publicly available technologies. The mRNA technique delivers a transcript that encodes one or more immunogens into the host cell, and subsequent translation generates immunogenic proteins. The advantage of mRNA vaccines is their ability to be developed and produced in large quantities more quickly.

Policy Coverage

For Childhood Immunizations: 0-18 years of age

- The most recent recommendations of the American Academy of Pediatrics (AAP) for preventive childhood immunizations are considered **medically necessary**.
 - American Academy of Pediatrics: <https://downloads.aap.org/AAP/PDF/AAP-Immunization-Schedule.pdf>
- **Not Medically Necessary:** Childhood immunizations are considered **not medically necessary** for all other indications not listed in the link above.
- Mountain Health Co-Op does not cover 90482, 90483, or 90484 because it considers them to include the office visit and administration of the vaccine.

For Adult Immunization: 18 years of age and over

- The most recent recommendations of the American Academy of Family Physicians (AAFP) for adult immunizations are considered **medically necessary**.
 - American Academy of Family Physicians: <https://www.aafp.org/family-physician/patient-care/prevention-wellness/immunizations-vaccines/immunization-schedules/adult-immunization-schedule.html?>
- **Not Medically Necessary:** Adult immunizations are considered **not medically necessary** for all other indications not listed in the link above.
- Mountain Health Co-Op does not cover 90482, 90483, or 90484 because it considers them to include the office visit and administration of the vaccine.

Note:

Recommendations for childhood and adult immunizations are reviewed on an individual basis to determine medical necessity and will be updated accordingly.
